Energy Risk Lab Austin, TX September 10, 2014

Purpose of Today

- Explore decision-making under conditions of uncertainty
- Understand interaction between EPA rules
- Explore motivators for gas capacity additions in comparison to motivators for other electric generation additions
- Explore regulatory roles, options, and bottlenecks when faced with decision-making requirements when the future is unknown and dynamic.

Today's Agenda

- Overview of Mercury and Air Toxics Standard (MATS)
- MATS scenario exercise
- The Calamity Round
- Section 111 of the CAA (including the Clean Power Plan, Sect. 111d)
- Wrap Up and Discussion

As we know, there are known knowns. There are things we know we know. We also know there are known unknowns. That is to say we know there are some things we do not know. But there are also unknown unknowns, the ones we don't know we don't know. – Donald Rumsfeld

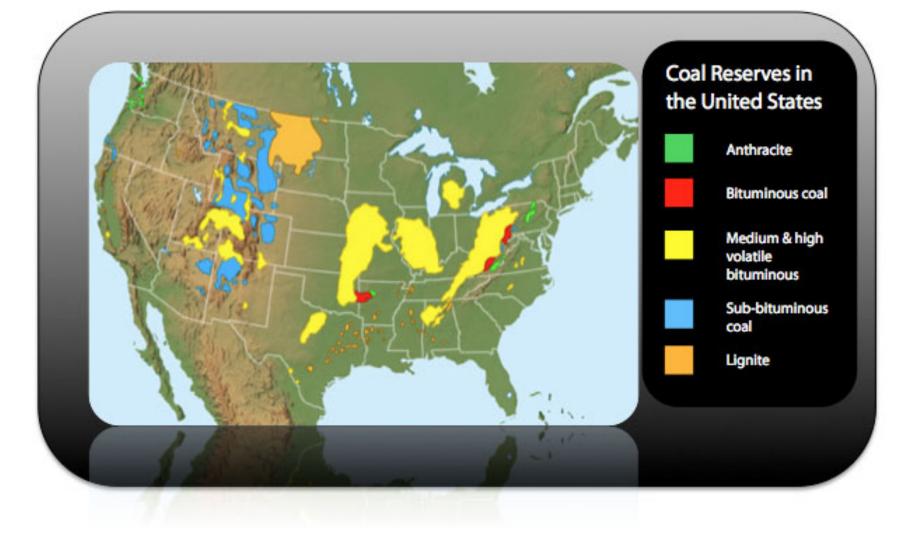

Knowns and unknowns affecting the electric sector:

- Environmental rules (i.e. MATS)
- Fuel prices (i.e. gas)
- Policy preferences (i.e. RPS, EERS)
- Markets, regulations, people
- Many others!

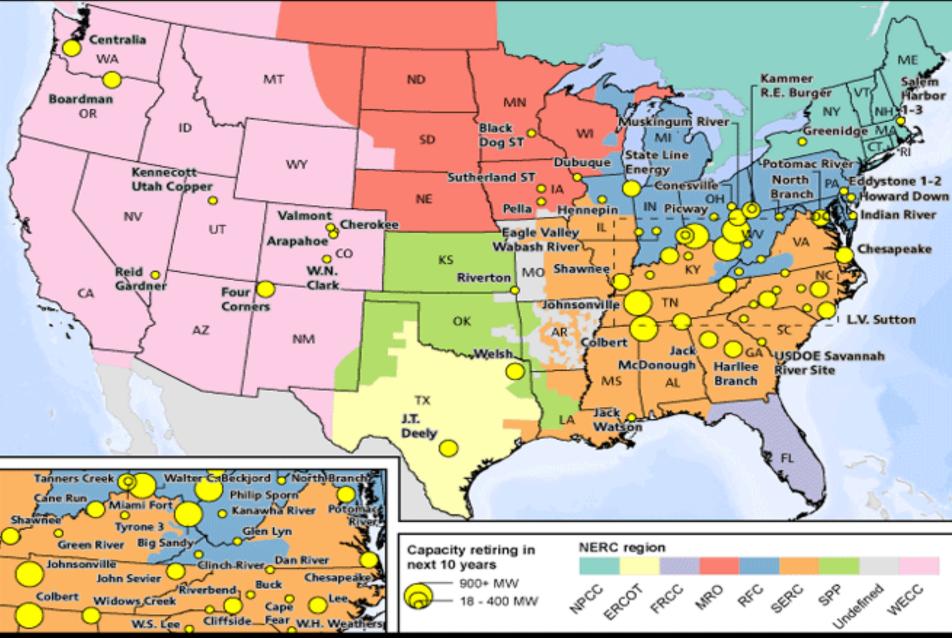

What does the Mercury and Air Toxics Standards (MATS) require?

- Reduction of the following pollutants
 - Mercury (Hg)
 - Hydrogen chloride (HCI)
 - Filterable particulate matter (fPM)
- Compliance period
 - 3 years
 - + 1 for technology installation (add controls, upgrade transmission, build replacement power)
 - -+1 additional for reliability critical units

Emissions Vary by Coal Type

Announced coal plant capacity retirements 2011-2020

As of Sept. 14, 2011 Source: SNL Energy Map credit: Jesse Bellavance

What are the compliance options?

RETIRE

- Long term PPAs
- Market capacity purchase

REPOWER

- Natural gas, biomass, other
- Switch to low sulfur coal
- Partial or full plant replacement

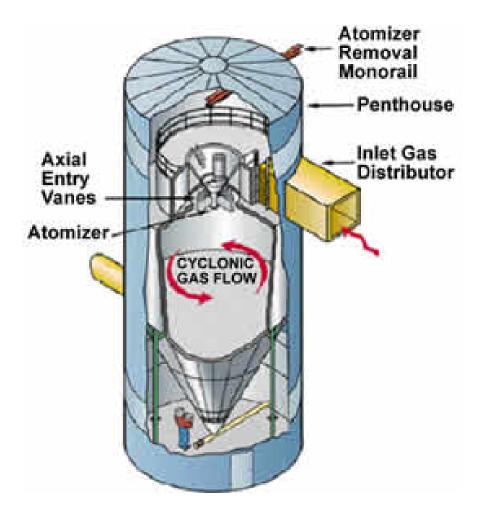

RETROFIT

- Upgrade ESP or Baghouse
- Scrubber
- ACI

Control technology for MATS

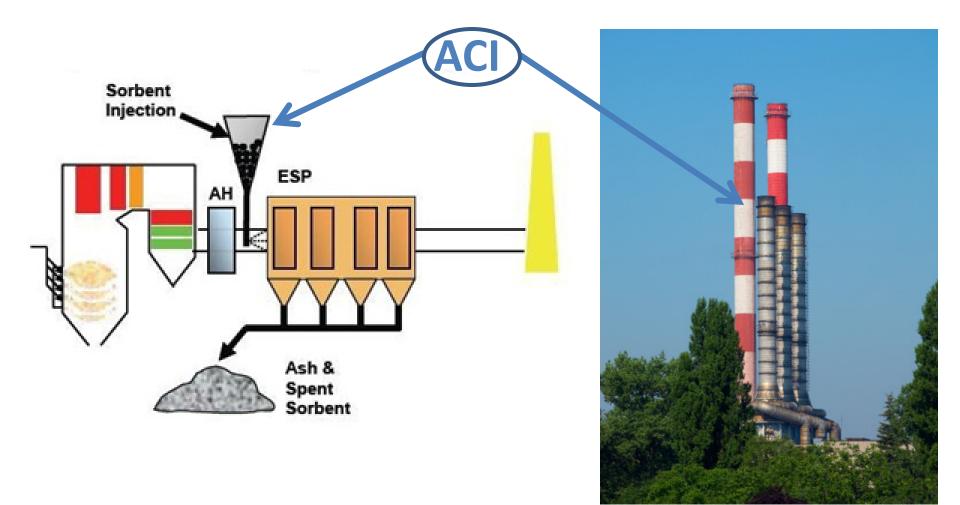

- Mercury
 - Scrubbers: Flue Gas Desulfurization (FGD)
 - Activated Carbon Injection (ACI)
- Non-mercury metals
 - Fabric Filter
 - Electrostatic Precipitator (ESP)
- Acid Gases
 - FGD Scrubber
- PM2.5
 - Fabric filter, or Baghouse 100% solution for PM compliance. Existing may need upgrades
 - Electrostatic Precipitator (ESP)

FGDs: big, pricey, and effective

ACI: Inexpensive, Less Coverage

The Correct Control Equation

- ACI + Baghouse? Baghouse + FGD? ESP + FGD? In the real world, the most appropriate configuration to control MATS pollutants is dependent upon fuel, existing infrastructure, and controls. It will vary plant by plant.
- In this lab you are limited to two MATS pollutant control options: ACI and FGD.
 - ACI controls for mercury only and requires subbituminous coal.
 - FGD addresses all MATS pollutants and more.
 No coal rank restriction.

Demand Side Resources

- Not strictly a compliance option for MATS
- Underexplored as useful companion strategy
- Can be utilized to
 - Assist in outage periods while installing controls
 - Assist with reliability
 - Control cost of implementation
- Benefits
 - May have shorter lead time
 - May delay costs
 - May address demand growth

What are Demand Side Resources in this Lab?

- Technologies or programs that reduce* the load on electricity network:
 - Energy Efficiency Technologies and Programs (projected to double by 2015 in Eastern Interconnection)
 - Demand Response/Load Management Changes* in enduse electricity
 - Smart grid reduce GTD losses, data provided by smart meters can help ID savings opportunities, can enable demand response
 - Volt/Var, System Efficiency smart grid application for distribution grid; demand reduction, energy loss reduction, improved power quality

Lead times

- What has to happen before you start operating your power plant?
 - <u>Develop your strategy (retire, retrofit, repower)</u>
 - Design or redesign plant
 - Secure capital \$\$
 - Obtain permits
 - Parts and equipment procurement
 - Construction and outages

Variable inputs for retrofit time

- Supply chain availability
 - Engineers, manufacturers, fabrication shops, craft labor, construction managers
- Cost
 - As compliance date approaches, more manpower needed, costs rise for overtime pay, supply rush, etc.
- Time crunch
 - ISO estimates 4-6 maintenance cycles for outage management, but the last two will be very busy
- How do you solve a bottleneck?

New Source Performance Standard and Replacement of Coal

• Requires all new plants to have CO2 emissions approximately as low as combined cycle gas.

• What does this mean? In Round 1 of the Lab you can't replace a coal plant with another non-CCS coal plant.

Game On

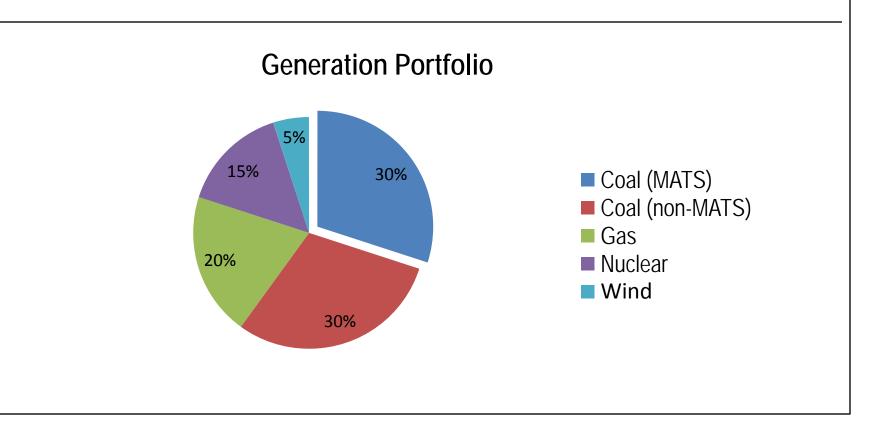

Meet your team!

Order of Play

- Round 1: The MATS round
- Round 2: Navigate Calamity
- Round 3: The 111d round
- Round 4: The Impossible Box

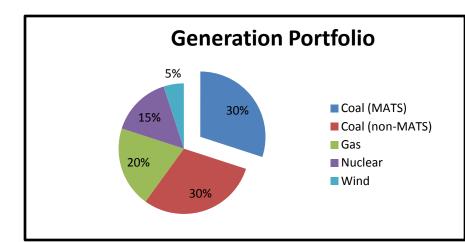

Your Electricity Portfolio

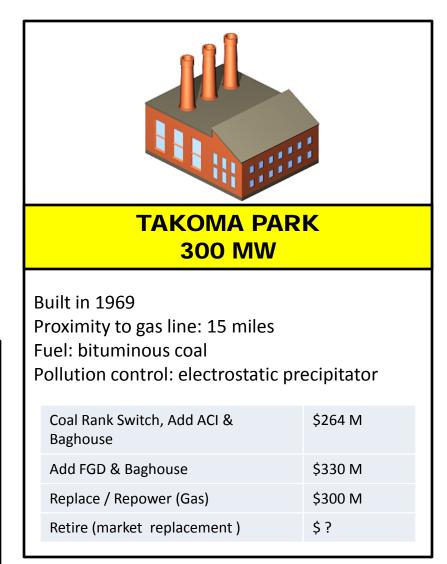

Net Capacity: 10,000 Megawatts Primary Energy Source: Coal Coal producing state and net importer Vertically integrated utilities 40 % Industrial/commercial sector vs. 60% res Average retail price: \$0.08/kWh Participates in RTO market Includes reserve margin (12%)

Round 1

- Select compliance strategy for six plants
- Meet your power plants!

FOREST GLEN 1100 MW

Built in 1985 Fuel: sub-bituminous coal Once-through cooling system Proximity to gas line: 50 miles Pollution control: baghouse & SCR

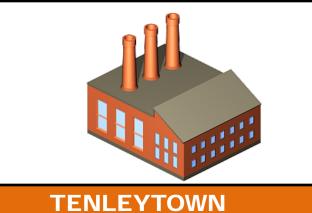

Add ACI	\$88 M
Add FGD	\$880 M
Replace / Repower (Gas)	\$1.1B
CO2 emissions @ 5000t/MW/y:	5.5m t/yr

TAKOMA PARK 300 MW

Built in 1969 Fuel: bituminous coal Once-through cooling system Proximity to gas line: 15 miles Pollution control: electrostatic precipitator

Coal Rank Switch, Add ACI & Baghouse	\$264 M
Add FGD & Baghouse	\$330 M
Replace / Repower (Gas)	\$300 M
CO2 emissions @ 5000t/MW/y:	1.5m t/yr

TENLEYTOWN 600 MW

Built in 1970 Fuel: sub-bituminous coal Once-through cooling system Proximity to gas line: over 50 miles Pollution control: electrostatic precipitator & baghouse

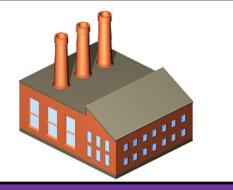

Add ACI	\$48 M
Add FGD	\$480 M
Replace / Repower (Gas)	\$600 M
CO2 emissions @ 5000t/MW/y:	3m t/yr

TYSONS II 200 MW

Built in 1963 Fuel: sub-bituminous coal Once-through cooling system Proximity to gas line: connected Pollution control: electrostatic precipitator

Add ACI & Baghouse	\$76 M
Add FGD & Baghouse	\$220 M
Replace / Repower (Gas)	\$200 M
CO2 emissions @ 5000t/MW/y:	1m t/yr

BETHESDA 700 MW

Built in 1973 Fuel: bituminous coal Once-through cooling system Proximity to gas line: 20 miles Pollution controls: baghouse, electrostatic precipitator, selective catalytic reduction (SCR)

	Switch Coal Rank, Add ACI	\$406 M
	Add FGD	\$560 M
	Replace / Repower (Gas)	\$700 M
C	CO2 emissions @ 5000t/MW/y:	3.5m t/yr

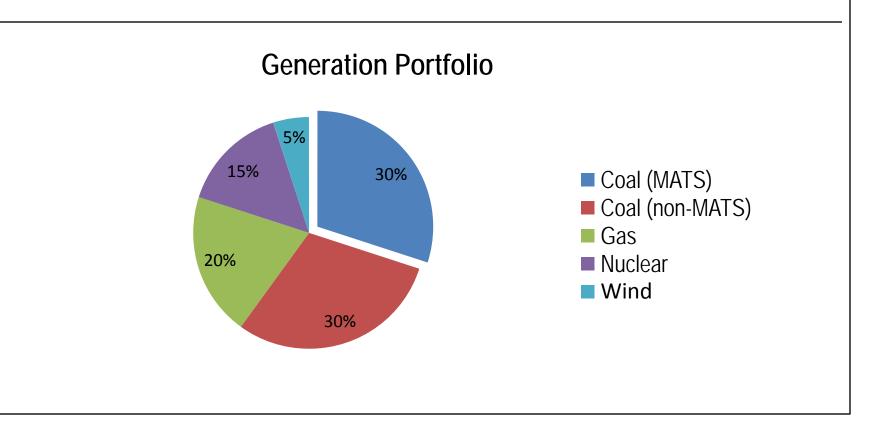

SHADY GROVE 100 MW

Built in 1957 Fuel: sub-bituminous coal Once-through cooling system Proximity to gas line: 100 miles Fuel: sub-bituminous coal Pollution controls: electrostatic precipitator

Add ACI & Baghouse	\$38 M
Add FGD & Baghouse	\$800 M
Replace / Repower (Gas)	\$100 M
CO2 emissions @ 5000t/MW/y:	0.5m t/yr

Your Electricity Portfolio

Net Capacity: 10,000 Megawatts Primary Energy Source: Coal Coal producing state and net importer Vertically integrated utilities 40 % Industrial/commercial sector vs. 60% res Average retail price: \$0.08/kWh Participates in RTO market Includes reserve margin (12%)

What are the compliance options?

RETIRE

- Long term PPAs
- Market capacity purchase

REPOWER

- Natural gas, biomass, other
- Switch to low sulfur coal
- Partial or full plant replacement

RETROFIT

- Upgrade ESP or Baghouse
- Scrubber
- ACI

Develop a Strategy for MATS Compliance

RETROFIT:

- Flue Gas
 Desulfurizer +
 Baghouse
- Baghouse + ACI*

 *sub-bituminous only <u>**REPLACE</u>**: with new noncoal unit</u>

REFUEL:

- from bituminous to sub-bituminous coal
- coal to natural gas

<u>RETIRE</u>: Must be replaced with a new unit, demandside resources, or other

POLLUTION CONTROL CONSTRUCTION COSTS

- **FGD**: \$800,000/MW
- **ESP**: \$200,000/MW
- Baghouse: \$300,000/MW
- ACI: \$80,000/MW

REFUEL

• Coal Rank Switch: bituminous to sub-bituminous: \$500,000/MW

DELIVERY INFRASTRUCTURE

- 30" Gas pipeline (firm): \$5m/mile
- Electric Transmission (infinite length): \$1m/MW

NEW RESOURCES

- Natural Gas (CCGT): \$1m/MW
- Nuclear (traditional, large-scale): \$10m/MW
- Nuclear (small modular reactors): \$7m/MW
- Wind Energy: \$2m/MW (by energy, not nameplate capacity)
- Solar Energy: \$5m/MW
- Demand Side Resources: \$0.5m/MW
- CHP / Waste Energy (up to 500 MW): \$0.5m/MW

DECARBONIZATION

- Heat Rate Improvement: +\$200,000/MW
- CCS: \$7m/MW
- Advanced Gas Turbine technology: +\$3m/MW

Shopping Cart

Round 1: MATS Discussion

- 1. What are the biggest challenges you are facing?
- 2. What strategies did you use to make decisions?
- 3. Trade-offs of different control options
- 4. Unknowns in decision-making (retire, refuel)
- 5. What regulatory structures provided opportunities and obstacles?
- 6. How can costs be contained through demandside measures?

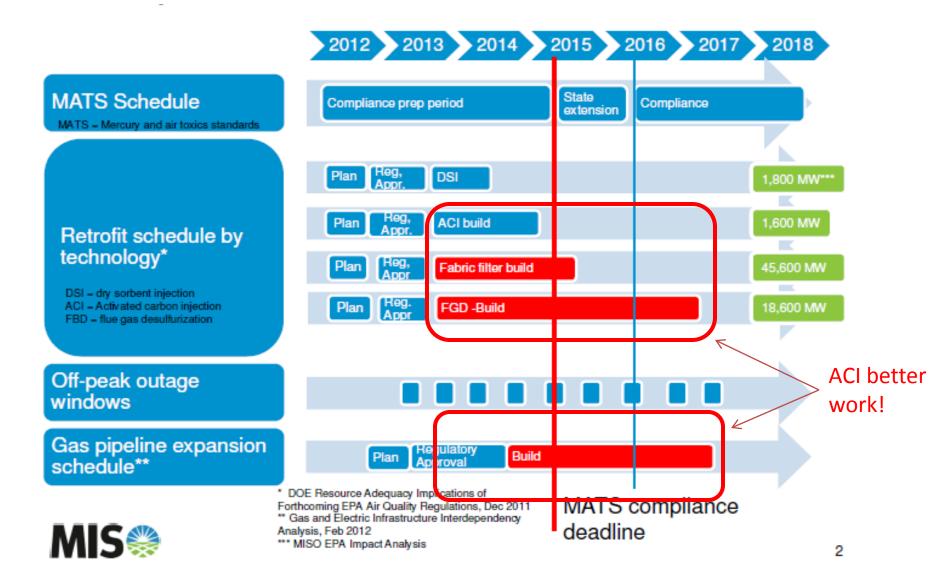

On to the next round!

Round 2: Calamities

- 1. MATS timing and technology issues
- 2. Gas price volatility and uncertainty
- 3. Gas pipeline and supply constraints
- 4. Nuclear relicensing and waste
- 5. Renewables and disruptive technology
- 6. Policy backlash possibilities
- 7. Carbon capture, utilization and storage
- 8. Load acting as supply

Do You Have Enough Time?

How helpful are forecasts?

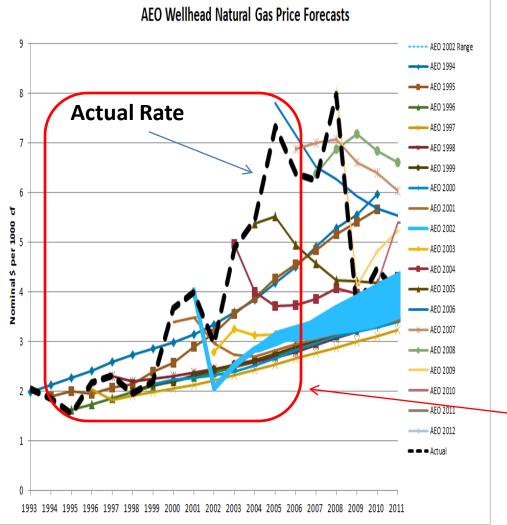

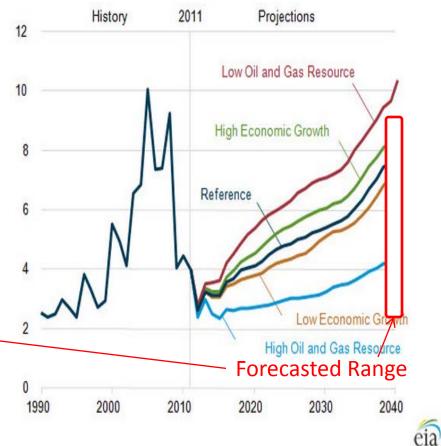

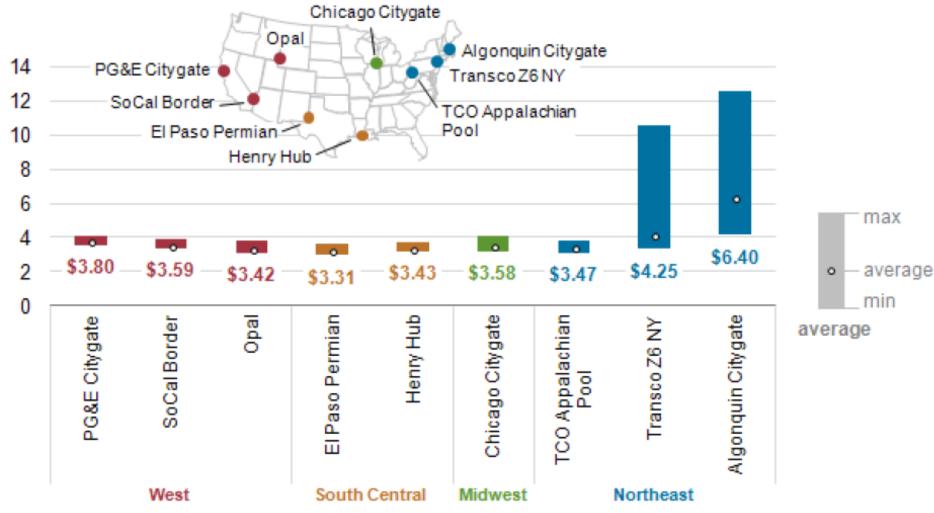

Figure 88. Annual average Henry Hub spot prices for natural gas in five cases, 1990-2040 (2011 dollars per million Btu)

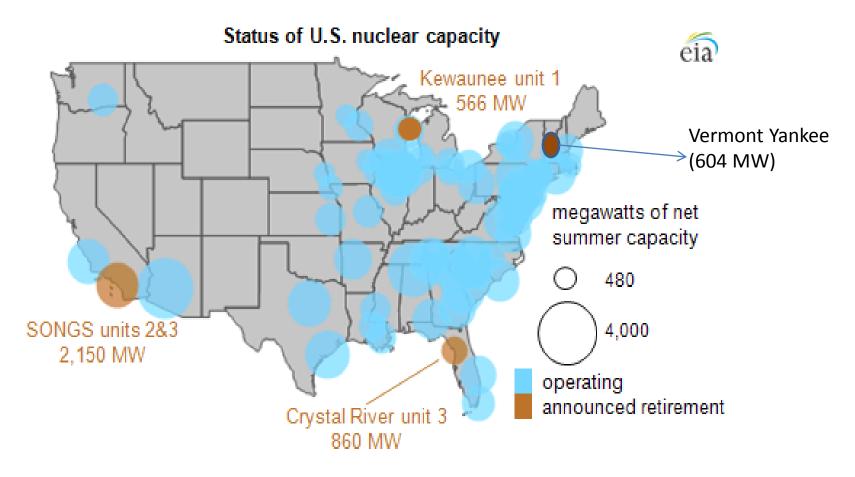

What if Gas Gets Constrained?

Spot natural gas prices at major trading locations from November 1 to December 31, 2012 \$/MMBtu

Source: U.S. Energy Information Administration based on Ventyx, Energy Velocity Suite.

Nuclear Relicensing and Retirement

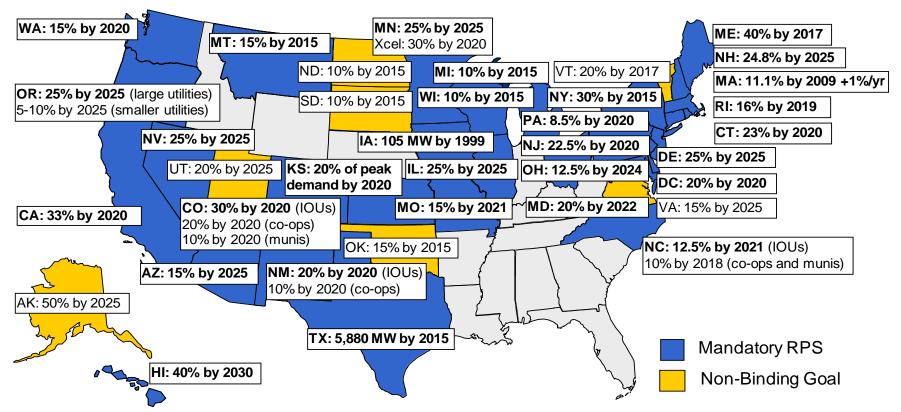

Five large uprate projects abandoned; four new reactors coming online.

RPS Policies Exist in 29 States and DC

7 More States Have Non-Binding Goals

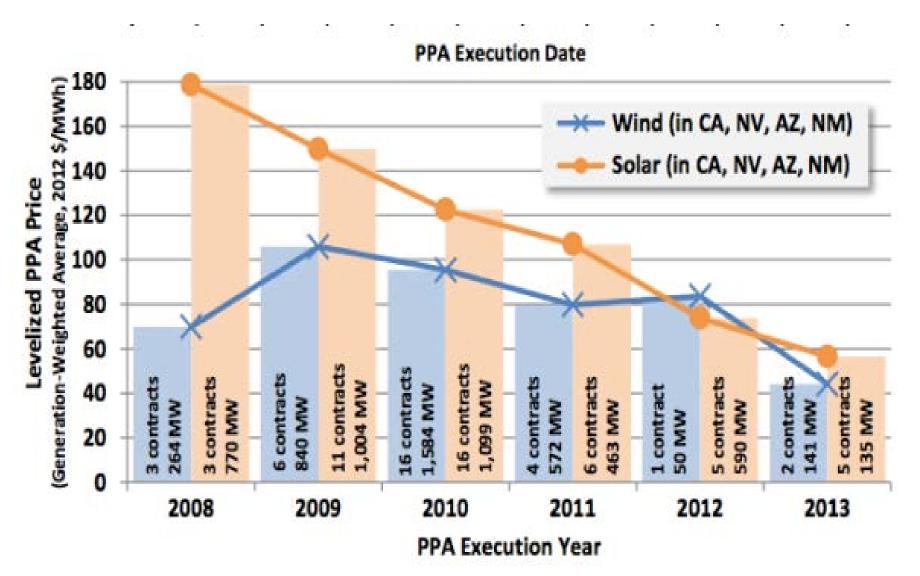

Existing State RPS Policies Apply to 55% of Total U.S. Retail Electricity Sales in 2012

Source: Berkeley Lab

Notes: Compliance years are designated by the calendar year in which they begin. Mandatory standards or non-binding goals also exist in US territories (American Samoa, Guam, Puerto Rico, US Virgin Islands)

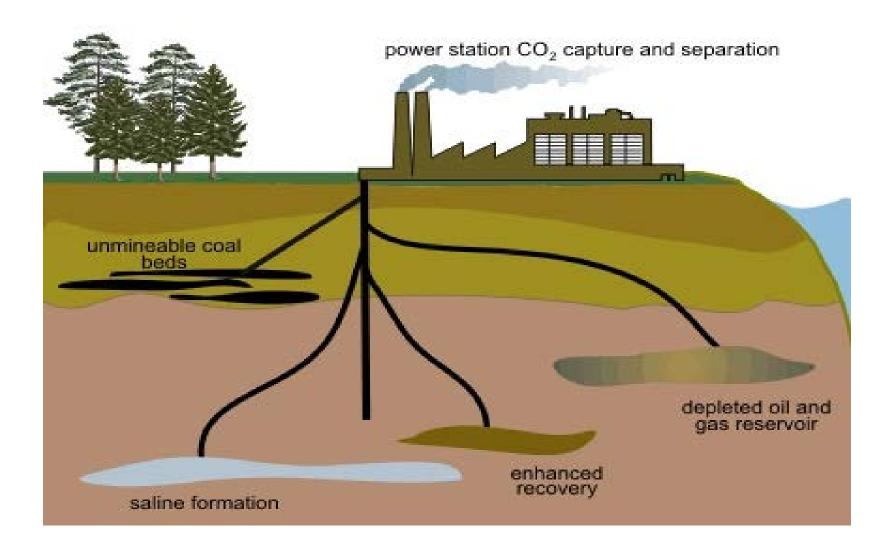

Renewables: Price

"Environmental Moderation"

Carbon Utilization & Storage

Combined Heat & Power

- We often make steam to turn turbines
- CHP uses that steam for heat and other applications.
- Often found in industrial, urban and "campus" situations
- Trade it in the game

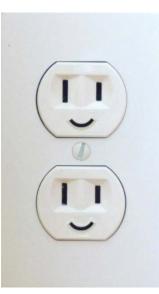

Load-side Supply: Integration

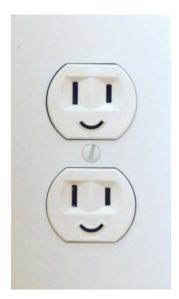

- Hawaii integration plans: on track to 40% RE by 2030, large contribution from solar distributed PV
- What will make this work?
 - Relatively high price of a kW
 - System flexibility
 - Smarter grid

Waste Storage Accident!

Cooling ponds at a domestic interim waste facility fail. Legislature bids "adieu" to nuclear energy for your team.

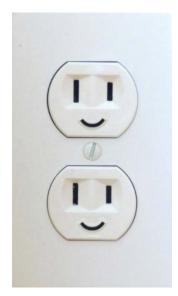

Flat, Friendly Farmland

You make siting and building transmission look sooo easy! Transmission is now \$500,000/MW for your team.

Calamity 3: Domestic nuclear storage accident & Cheap transmission

Retirement and Backlash

An additional 1500 MW announced retirement. The legislature passes a "Save Our Jobs Act" requiring your team to get 40% of supply from coalfueled resources

CHP Unleashed

Combined Heat And Power is no longer limited to 500MW for your team – it's now limited to 4000MW. And cheap! Cost reduced to \$400,000 / MW

Calamity 4: Additional coal retirement leads to backlash from legislature & CHP unconstrained

Some of you will face "special" challenges

Sweet!

Industrial customer demand for steam goes bananas.

Your CHP investment creates 1000 jobs!

Dude, the Haiku

Angry ratepayers express distress at rising rates. Sad haiku, for you.

Transmission!

- Transmission connects energy between tables
- Starts at \$1 million/MW capacity
- Some of you have SPECIAL FRIEND PRICING. (So, transmission is cheaper for you.)
- Some of you need resources you don't have.
- Buyers of energy build transmission.
- Sellers of energy sell their energy for whatever price they can get.
- You can sell energy from specific resources (coal, CHP, wind, solar, etc.) but not the attributes without energy (i.e., RECs, without transmission).
- Emissions stay with the seller.

Trading Example

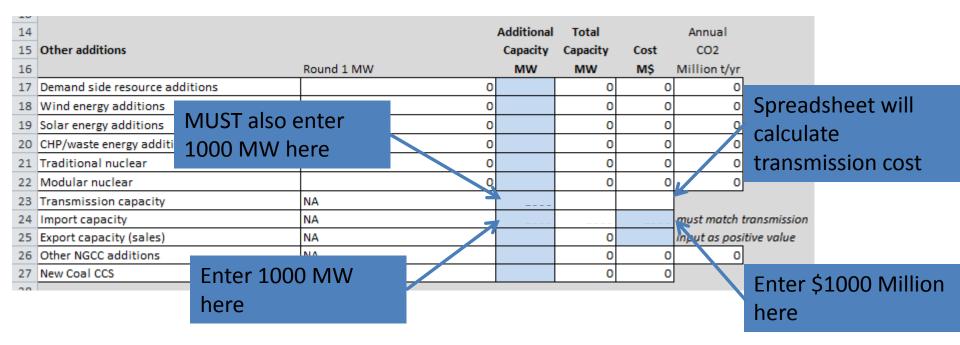

Team Longhorns sells Team Aggies 1000 MW of wind capacity and energy for \$1 billion (\$1M/MW)

Team Longhorns spreadsheet

Trading Example

Team Aggies spreadsheet

We're From The Lab, We're Here To Help

Round 2: Discussion

- 1. What impact did gas tightening have on the overall portfolio?
- 2. What happened when nuclear waste and relicensing issues arose?
- 3. How would decisions for CSAPR (affecting NOx and other interstate pollutants) overlay with decisions for the MATS rule?
- 4. How did demand-side resources and EE impact the system? Were any constraints self-imposed, or externally imposed?
- 5. Do renewables change the picture?
- 6. What regulatory structures provided opportunities and obstacles?

Round 3: The Clean Power Plan – Section 111d for Existing Units

The Top Line

- President's 2013 Climate Action Plan called for power plant regulations
- Power plants ~ 30% of U.S. greenhouse gas emissions
- Suite of rules under Clean Air Act Section 111
 - New plants (proposed rule: January)
 - Modified/reconstructed (proposed rule: early June)
 - Existing plants (proposed rule: early June)
- Existing plants: federal-state process

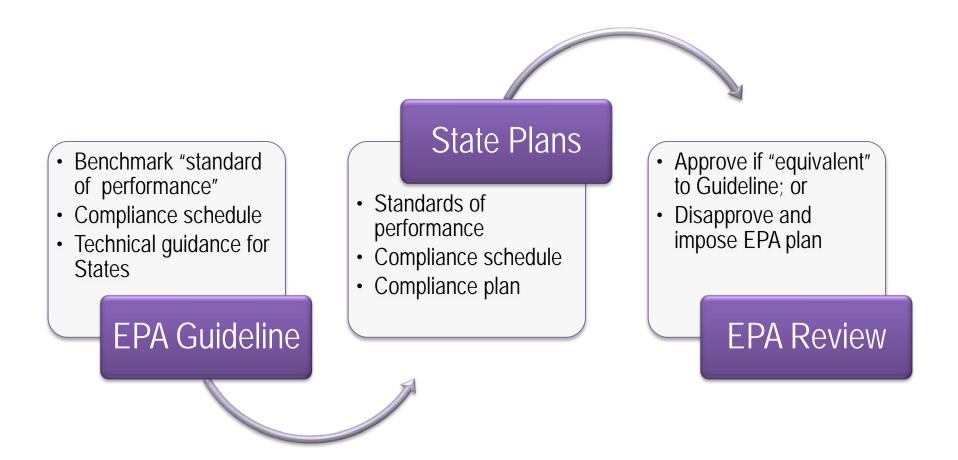

Section 111 of the Clean Air Act

- Standards of performance for major sources of pollution
 - Defined as an emission limitation based on "best system of emission reduction" that has been "adequately demonstrated" taking into account cost
- Sec. 111(*b*): standards of performance for **new** sources
 - EPA sets standard
- Sec. 111(*d*): standards of performance for **existing** sources
 - States set standard subject to EPA approval
 - Relatively little experience with 111(d)

Section 111(d) Rulemaking

- EPA issues binding emissions rate goals to states
 - Proposed rule published June 18, 2014
 - Final rule due June 2015
- States submit compliance plans
 - Plans due June 30, 2016
 - "Equivalency" requirement
- EPA approves/disapproves
- Compliance deadline for power plants: 2020 2030

111(d) Federal-State Process

What's Covered:

- All fossil units 25 MW and over,
- Combustion turbines over 25 MW greater than 33% capacity factor.
- Estimate: 3,084 EGUs and NGCC units affected
- **532.4 GW of generating capacity**
- This represents approximately half of total generating capacity in the U.S. as of the first quarter of 2014 (with the rest being primarily nuclear, hydro and wind), and 70 percent of U.S. fossil generating capacity.

Approaches inside the fenceline

- Heat rate improvements
- Conversion to lower carbon-intensive burning
- Unit operating limitations
- Emissions averaging over time
- Retirement / replacement
- Bubbling of multi-unit emissions on-site

Approaches as a system

- Trading among units (single or multi-state) under an emissions budget (mass-based or ratebased)
- Actions not specific to covered units (lowering or displacing emissions and/or output at units)
 - New unit operations with lower emissions, including gas, nuclear, hydro, renewables
 - Demand-side measures
- Dispatch constraints
- Carbon pricing

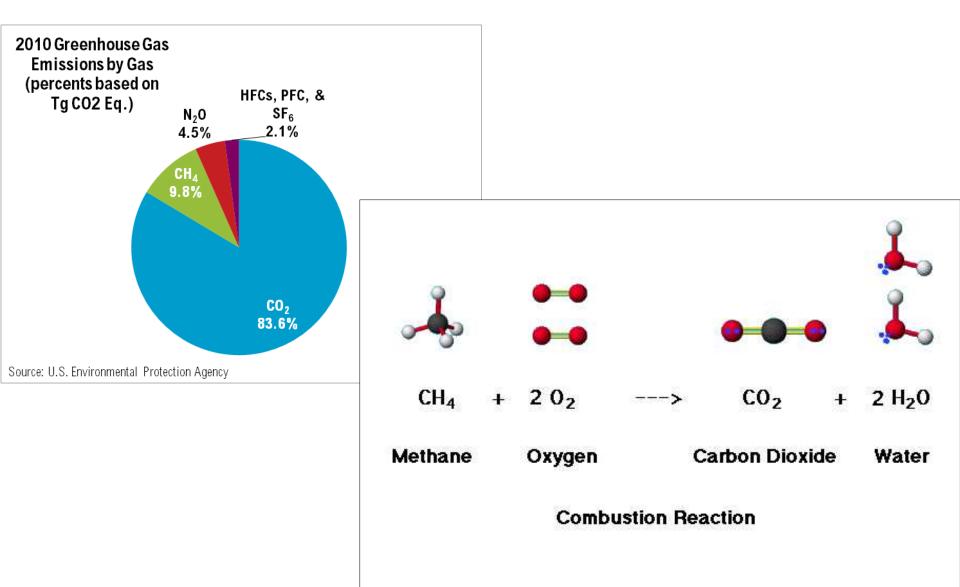

A brief primer on CO2 reductions

But first:

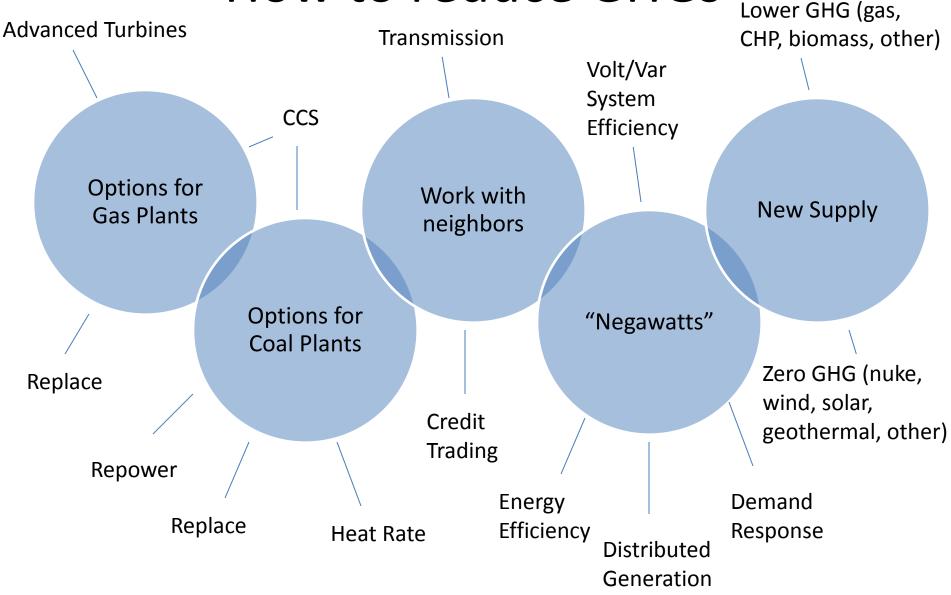

- The Lab takes no position on what happens when CO2 is emitted.
- The Lab takes no position on whether the emissions of CO2 should be regulated.
- The Lab explores what choices one has if one is required to reduce the emissions of CO2.

Combustion means Releasing CO2

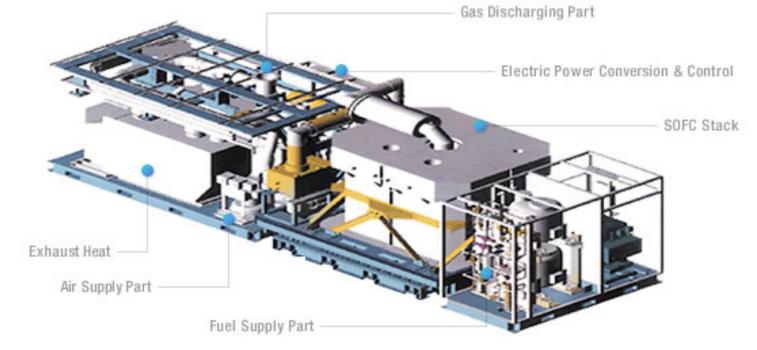

How to reduce GHGs

Gas Options

- Gas already has lower embedded CO2 emissions than coal, so gas switching helps
- Decarbonizing gas means higher efficiency, less dispatch, or new technology

30 seconds on Carbon Capture

"Hurricane Cruella"

Your Mission: Develop a State Compliance Plan

- A State Compliance Plan is a plan that describes strategies – "measures" – to demonstrate how your State will decrease emissions of the specified pollutant.
- The results of the new technology performance standards mean that

your Compliance Plan must describe measures that reduce CO2 emissions over 10 years

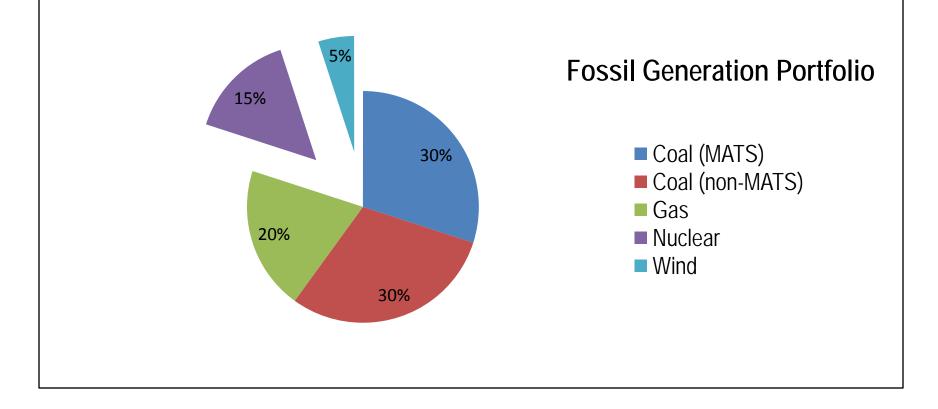

from 34 million tons of CO2/yr to 18 million tons CO2/yr.

Your Emissions Profile

Net Capacity: 10,000 Megawatts 80% of the fleet emits GHGs Coal fleet averages 5000 t/MW/yr Gas fleet averages 2000 t/MW/yr

Nuclear, DSM, and RE assumed to have zero emissions

Fossil Fleet current avg. is 4,250 t/MW/yr Fossil Fleet target 2,250 t/MW/yr

GHG Emissions Cart

NEW RESOURCES – GAME ONLY – REAL LIFE RESOURCE EMISSIONS ARE NOT THIS SIMPLE

•	Natural Gas (CCGT) \$1m/MW	2000 t/MW/yr(40% of unctrl coal emissions)
•	Nuclear (traditional, large-scale): \$10m/MW	0
•	Nuclear (small modular reactors): \$7m/MW	0
•	Wind Energy: \$2m/MW (by energy, not nameplate capacity)	0
•	Solar Energy: \$5m/MW	0
•	Demand Side Resources: \$0.5m/MW	0
•	CHP / Waste Energy (up to 500MW): \$0.5m/MW10	000 t/MW/yr (20% of unctrl coal emissions)

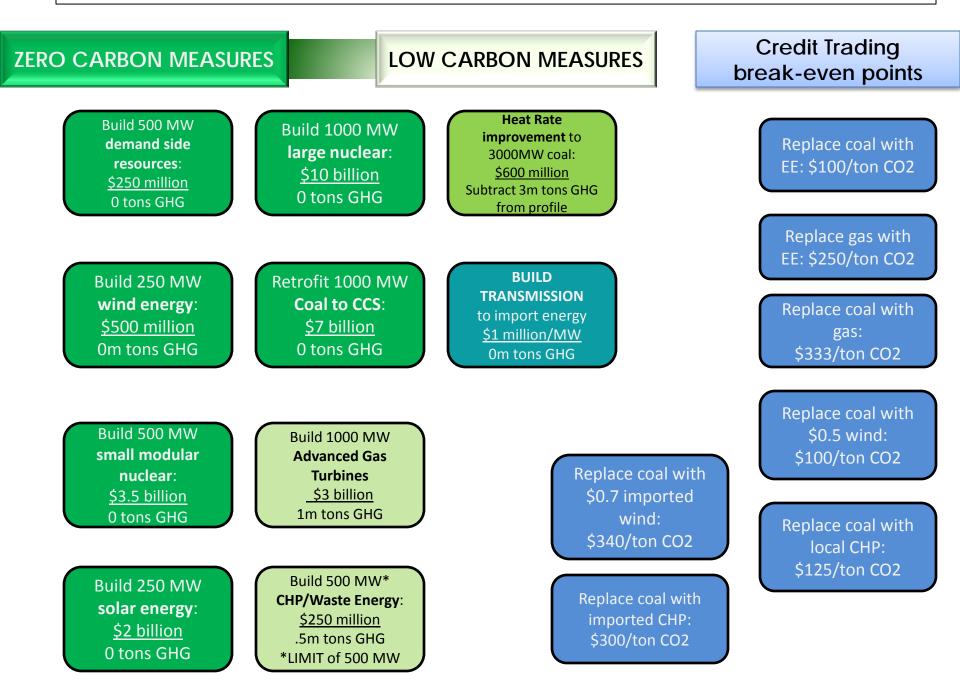

DECARBONIZATION

•	Coal only - 20% Heat Rate Improvement: \$0.2m/MW4000	t/MW/yr (80% of unctrl coal emissions)
•	New CCS: \$7m/MW	0 for each MW applied
٠	Advanced Gas Turbines: \$3 m/MW	1000 t/MW/yr

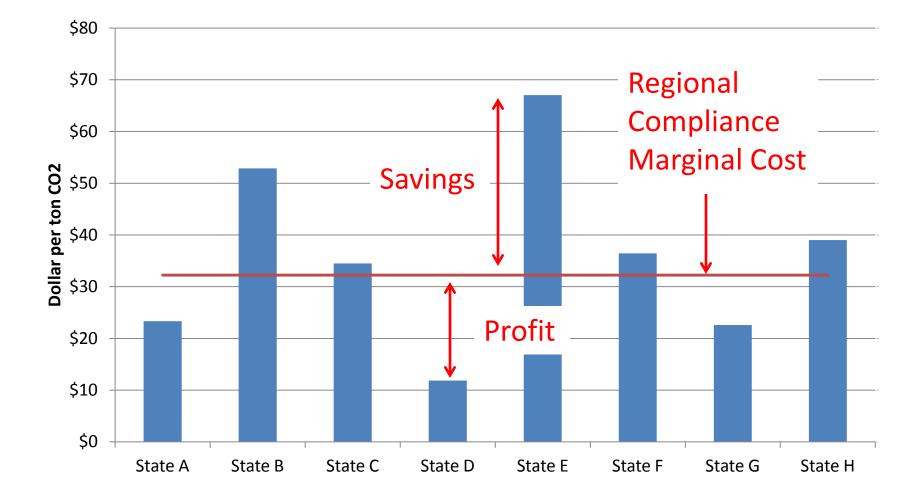

Your Current GHG Emissions

Units	MW	CO2 emissions, million t/yr
MATS-Affected coal		5000 t/MW/y
Tenleytown	600	3
Tysons 2	200	1
Shady Grove	100	0.5
Takoma Park	300	1.5
Forest Glen	1100	5.5
Bethesda	700	3.5
	3000	15
Non-MATS coal		5000 t/MW/y
Ballston		
McPherson Square		
Navy Yard	3000	15
Franconia-Springfield		
Van Dorn Street		
Gas Fired		2000 t/MW/y
Twinbrook		
Cardozo	2000	4
Shaw	2000	4
Waterfront		
Total	8000	34

EXTRA VALUE MENU - Assumes full price for everything. If your prices are lower, you can cut a better deal.

Marginal Cost CO2 Reductions in 2020

Transmission and Credit Trading

- All emissions are credited where they occur
- If a neighbor can over-comply with CO2 regulations, (i.e. get below 18 M tons/yr) you can work out a deal to buy their CO2 credits.
- Transmission allows you to buy capacity and GHG reductions; credits only help with your GHG emissions reduction State Implementation Plan (SIP).

Sect 111d / Clean Power Plan in Play

Reduce your CO2 emissions from 34m tons CO2/year to 18m tons CO2/year by 2023

- 1. Look at your fleet and make choices that reduce GHG emissions
 - 1. Different supply choices with low/no GHG profile
 - 2. Non-supply resource choices: demand, delivery
- 2. Look outside your fleet for reductions
- 3. Explore whether other tables might be able to offer credits or lower carbon power based on their strategies

Costs

- What were the rate impacts of your decisions?
- What will the effect on ratepayers be? Are there political risks?
- What will the effects on credit-worthiness be? Who bears them?

Strategy for 111d

- What is your compliance strategy? How much of each compliance option did you leverage to arrive at your emission target?
- Did you engage in any interstate transactions for compliance? (trading, transmission, resource averaging, etc.)
- What investments you make now will help in long-run?
- What are the trade-offs between compliance options?
- Are you anticipating emerging drivers, (i.e. regulatory, policy, market, technology)?
- Who do you need to be talking with to implement these measures?

Round 4: What about...

- Consider: S.316b rules
- Consider: Clean Energy Standard legislation
- Consider: No Carbon Pricing requirements
- Consider: Managing intermittent resources
- Consider: Rapid, energy-intense economic recovery
- Consider: Fracturing moratoria
- Consider: Flat utility revenues
- Consider: Competition for capital, financial health of utilities
- Consider: disruptive technologies or business models

YOUR MISSION: ESCAPE FROM THE IMPOSSIBLE BOX

Least-cost, Least-risk?

- What was the least risky course?
- What decisions seemed risk-avoidant but incurred consequences?
- What coordination would have helped from the outset? Is integrated gas / transmission / generation planning an answer?
- How did waiting for rule finalization affect decisions?
- Are there decision-making processes that steer towards lower-risk outcomes?
- What was the value of a diverse portfolio?

GAME OVER
